

Aron Frishberg

frishberg@uchicago.edu | github.com/frishberg | aronfrishberg.com

EDUCATION

The University of Chicago

Bachelors in Computer Science & Bachelors in Economics

GPA: 3.7; SAT: 1530 (790M, 740RW)

Relevant Coursework: Data Structures, Theory of Algorithms, Discrete Mathematics, Systems Programming, Financial Accounting

Activities: Chabad (Board Member), Chess Club, Sailing Team, Phi Delta Theta

Chicago, IL

Expected June 2027

EXPERIENCE

Gatsby Robotics

Founder & CEO

San Francisco, CA

January 2026 - June 2026

Founded Gatsby, an on-demand platform for consumer humanoid robotics: made U.S. history for the first humanoid-robot home cleaning. Raised \$250K pre-seed from Entrepreneurs First; backed by NVIDIA.

- **Deployment:** Ran the first-ever consumer humanoid cleaning (May 2026), delivering the robot to a randomly selected SF waitlist customer; negotiated and closed a partnership in Mexico for remote-teleoperation; backed by Entrepreneurs First (\$250K Pre-Seed) & NVIDIA
- **Robotics:** Built a humanoid teleoperation stack from scratch by integrating frontier research from NVIDIA, Amazon and Stanford; engineered hybrid stack with manual teleoperation and trained autonomy to execute real tasks end-to-end
- **Product:** Solo-built and shipped the full consumer stack: published iOS app, web platform, booking system and the robot-agnostic distribution layer on top of third-party humanoid hardware
- **Traction:** Grew an early waitlist through guerrilla marketing (walking the robot through Salesforce Park at peak lunch hour, placing intriguing sidewalk decals all throughout SF), then converted the first-in-U.S. deployment into international press (Fox News, Times of India, and more), driving a surge in nationwide demand

Teragonia (*Seed Stage Startup*)

Data Analytics Intern

Chicago, IL

June 2025 - August 2025

- Independently engineered an AI-powered analytics tool overnight after the concept surfaced in a client meeting; presented to the CEO the next morning, who reassigned me off all other projects to develop it full-time for the summer
- Shipped a secure natural-language query layer (React, Python/Flask, Perplexity API) letting non-technical users analyze internal client datasets without exposing data externally; iterated continuously on feedback from both my team and PE clients
- Presented at the company's quarterly board meeting; the system is now integrated into Teragonia's flagship Astradis platform

Third Point (*AUM: \$22B*)

Summer Analyst, Technology Coverage Group

New York, NY

June 2024 - August 2024

- Covered semiconductors and global EV output, building financial models to project cash flows and company valuations
- Engaged with sell-side analysts and industry experts to refine equity research and enhance market perspectives
- Select project experience:
 - Developed an AI program to automate data scraping, significantly improving efficiency and accuracy by compiling extensive historical and projected xEV model data
 - Assembled a 15-year, bottom-up operating model and DCF analysis for a large semiconductor company; issued a 'Buy' rating due to projected growth in plug-in hybrid electric vehicle (PHEV) units and demand for AI semiconductors

PROJECTS

MoBot (SPC Physical AI Hackathon) • *OpenCV, Raspberry Pi, Python, CAD, 3D Printing* • **2nd Place**

[Website](#)

- Led a 5-person team to take a WALL-E-inspired cleaning robot from concept to a working autonomous demo in a 47-hour hackathon - owning both hardware and software end-to-end - placing 2nd of 30+ teams
- Designed every part in CAD and 3D-printed a custom embodiment on-site (iterating, fitting and finishing parts mid-event) on top of a wheeled mobile base with a Raspberry PI running the full software stack
- Built and fine-tuned an OpenCV vision system that reliably detects floor messes across varying floor types and lighting, then drives the robot to autonomously locate, approach and clean them - wrapped in a layer of expressive character

Chess-Analytica • *Python, RST, YAML*

[GitHub](#) / [PyPi](#) / [Documentation](#)

- Created, published, and maintained Chess-Analytica, a Python package for automating chess game data extraction and analysis that has become a go-to tool for developers
- Engineered the library to be highly modular and extensible, allowing users to easily add new analysis features and data sources, contributing to its growing popularity
- Achieved over 50,000 installs as of 2026, establishing it as one of the top Python libraries for chess analysis and demonstrating significant real-world impact and adoption

TECHNICAL SKILLS

Languages: Python, C/C++, JavaScript/TypeScript, SQL, HTML, CSS

ML & Robotics: PyTorch, OpenCV, teleoperation, imitation learning

Hardware: CAD, 3D printing, Raspberry Pi, embedded systems, sensor integration

Software & Infra: React, Flask, Node.js, iOS, REST APIs, AWS, Git
